

Project Synopsis: Autonomous AI Sales Executive & CRM Bot

Elevator Pitch

An end-to-end autonomous event management bot built on Telegram that operates as a high-ticket sales executive. Powered by Llama-3.3 (via Groq API) and Telethon, the system does not just answer FAQs—it actively negotiates, defends pricing, curates custom event themes, processes payment verification, and tracks live pipeline revenue in a persistent, automated CRM dashboard.

Tech Stack

- **Core Logic:** Python, `asyncio`
- **Bot Framework:** Telethon (Telegram API)
- **AI Engine:** Groq API (Llama-3.3-70b-versatile)
- **Data Persistence:** JSON-based local storage (`leads_crm.json`, `prompts.json`)

Core Features & Capabilities

1. Advanced AI Sales Psychology (The AI Brain)

- **Value-Based Negotiation:** The AI is strictly prompted to never instantly slash prices. It defends high-ticket value by offering strategic concessions (like free add-ons) to close deals, maximizing Average Order Value (AOV).
- **Emotional Storytelling Hooks:** Casually weaves in brief, touching stories about past events (e.g., a father-daughter dance) to sell the *emotion* of the service, not just the price tag.
- **Persona Integrity & Nuance:** Maintains a strict, undetectable human persona of an elite event coordinator with a specific passion for curating perfect audio and music vibes.
- **Off-Topic Pivoting:** Intelligently handles completely random customer questions (e.g., trivia, science) by answering them naturally, then immediately using a clever conversational bridge to pivot back to the sales pipeline.

2. Human-Computer Interaction / The "Humanizer" Module

- **Dynamic Read-Time Simulation:** Calculates the exact length of the customer's message and applies a natural reading delay (~0.3 seconds per word) before taking action.
- **Calculated Typing Pauses:** Triggers Telegram's native "typing..." indicator with simulated 1-to-3-second human "thinking" pauses mid-response.
- **Strategic Imperfections:** Features a mathematically calculated probability algorithm to occasionally drop trailing punctuation or inject adjacent-key typos (e.g., typing 's' instead of 'a'), making the bot indistinguishable from a human texting on the go.

3. Automated CRM & Revenue Tracking

- **Live Pipeline Analytics:** Automatically extracts agreed-upon package values from the AI's JSON output and logs them as `pending_amount` in the CRM pipeline.
- **Admin Dashboard Command:** Business owners can message the bot `/report` from authorized admin accounts to instantly receive a live breakdown of Total Revenue, Pipeline Value, Deals Closed, and Active Leads.
- **Persistent Data Storage:** Saves all CRM metrics and active user states to local storage, ensuring zero lead leakage even if the server restarts or crashes.
- **Abandoned Cart Recovery:** Features an asynchronous `asyncio` reminder loop that automatically follows up with leads who go quiet after receiving the payment QR code.

4. Dynamic Visuals & Asset Management

- **Context-Aware Portfolio Delivery:** The AI categorizes the lead's intent (e.g., "bday" vs. "wedding"). The bot then dynamically fetches and sends trust-building portfolio images exclusively from the matching category.
- **On-the-Fly Google Theme Sourcing:** If a customer requests an obscure or custom theme, the AI constructs a precise Google Images search query, formats it into a clean Markdown hyperlink, and sends it to the user for instant visual inspiration.
- **Customer Image Ingestion:** If a customer uploads their own reference photo, the bot recognizes it, thanks them, and forwards the image to the Admin dashboard with an inline [ Acknowledge Theme] button for review.

5. Secure Payment Gateway & Verification

- **Automated QR Delivery:** Automatically deploys the payment QR code and terms of service the moment a customer agrees to a package.
- **Admin Approval Flow:** Forwards customer payment screenshots to the admin with inline Telegram buttons ( Confirm ₹[Amount] /  Reject).
- **Closed-Won Automation:** Upon admin confirmation, the bot instantly updates the CRM database (moving Pipeline Value to Total Revenue), cancels any pending follow-up reminders, and sends a final confirmation to the customer.

Why This Matters for Your Resume / Interview Talking Points

When discussing this project, emphasize these three pillars:

1. **"I built a system focused on Conversion, not just Conversation."** Explain how the AI doesn't just chat; it uses negotiation tactics, value stacking, and follow-up loops to prevent lead drop-off and drive actual revenue.
2. **"I solved the 'AI Uncanny Valley' problem."** Talk about the `humanizer.py` script. Businesses lose trust when customers realize they are talking to a bot. Your dynamic read delays and strategic typos solve a real-world user experience (UX) problem.
3. **"I created an operational tool for business owners."** You didn't just build a bot; you built a lightweight CRM. The `/report` feature and screenshot verification flow prove that you understand how business operations, data tracking, and admin controls work in the real world.
